ICNARC report on COVID-19 in critical care: England, Wales and Northern Ireland

13 November 2020

This report presents analyses of data on patients critically ill with confirmed COVID-19, reported to ICNARC up to 4pm on 12 November 2020, from critical care units participating in the Case Mix Programme (the national clinical audit covering all NHS adult, general intensive care and combined intensive care/high dependency units in England, Wales and Northern Ireland, plus some additional specialist and non-NHS critical care units).

Data are reported separately for patients critically ill with confirmed COVID-19 either at or after the start of critical care:

- admitted from 1 September 2020 to date; and
- admitted up to 31 August 2020.

Please note that adult critical care units in Scotland, paediatric intensive care units and neonatal intensive care units do not participate in the Case Mix Programme.

Reporting process

Critical care units participating in the Case Mix Programme are asked to:

- log a case with ICNARC by submitting a record, with minimal data, as soon as they have an admission with confirmed COVID-19;
- resubmit data, including first 24-hour physiology, as soon as possible after the end of the first 24 hours in critical care;
- resubmit data for the whole critical care stay, including critical care outcome and organ support, when the patient leaves critical care; and
- submit final data when the patient leaves acute hospital.

ICNARC have logged data for 4485 admissions of 4035 patients critically ill with confirmed COVID-19, either at or after the start of critical care, admitted from 1 September 2020 to date in England, Wales and Northern Ireland. Of these, data covering the first 24 hours of critical care have been submitted to ICNARC for 3744 patients (Figure 1). Of the 4035 total patients, 2690 have outcomes reported and 1345 patients were last reported as still receiving critical care. These patients are compared with a cohort of 10,910 patients with confirmed COVID-19 admitted up to 31 August 2020.

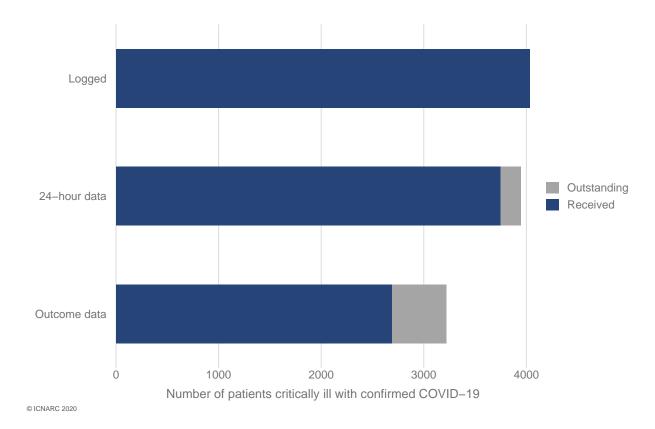

Figure 1. Numbers of critically ill patients with confirmed COVID-19 admitted from 1 September 2020 with data included in this report and outstanding *

* Please note that 24-hour data are considered outstanding when a case was logged at least 48 hours previously and outcome data are considered outstanding when 24-hour data have been received and at least 10 days have elapsed since the start of critical care.

Of the 4035 patients critically ill with confirmed COVID-19 admitted from 1 September 2020 to date, the largest numbers were admitted in the North West, North East And Yorkshire, and Midlands regions (Figure 2). Of the patients included in this week's report, 1433 patients were admitted to critical care within the past 14 days (29 Oct 2020 to 11 Nov 2020). The geographical spread of these patients was similar to that for all patients admitted from 1 September 2020 to date (Figure 3).

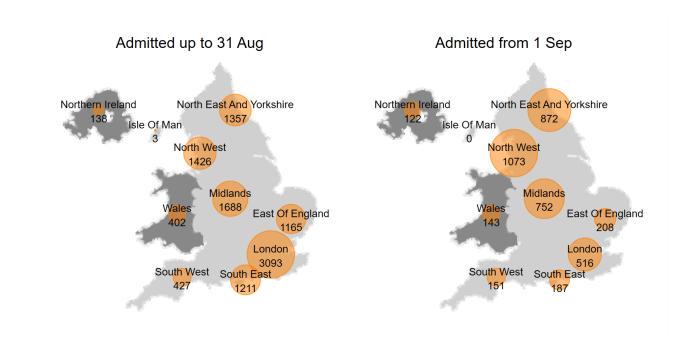

Figure 2. Geographical distribution of patients critically ill with confirmed COVID-19

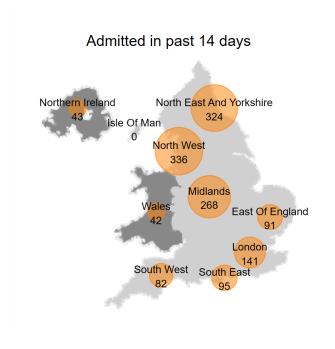

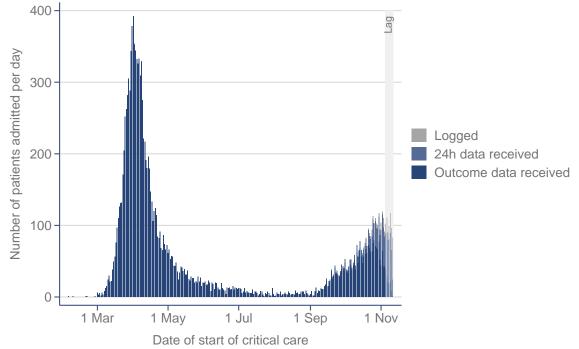

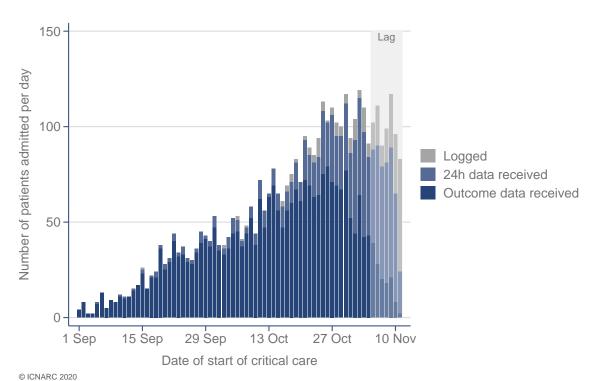

Figure 3. Geographical distribution of patients critically ill with confirmed COVID-19 admitted during the past 14 days

The numbers of new patients, cumulative numbers of patients and numbers of patients in critical care by date are shown in Figures 4-12. Please note that these figures are affected by a variable lag time for submission of data.

* Please note patients whose outcome data have not been received are assumed to remain in critical care as of 12 November 2020. Dahsed line indicates potential lag in data submission.

Figure 13 shows the total numbers of admissions to critical care over the past five years by month of admission reported as due to pneumonia (not COVID-19), compared with the numbers with confirmed COVID-19. Figure 14 shows the number of these pneumonia admissions that were specifically coded as due to influenza. Note that not all admissions due to influenza will be coded as viral pneumonia (influenza) as if the organism has not yet been identified, then these will likely be coded under pneumonia (no organism isolated).

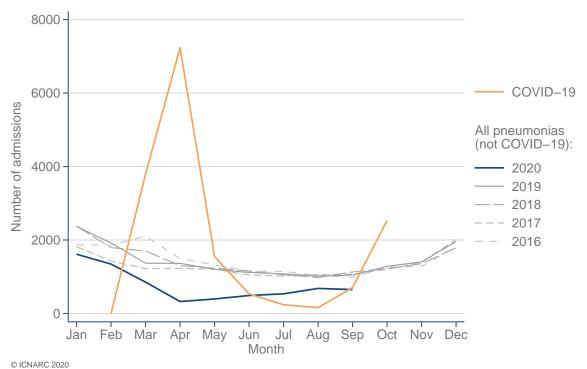

Figure 13. Number of admissions with pneumonia (not COVID-19) by month, 2016-2020 *, compared with confirmed COVID-19 during 2020

* Please note that data for patients without COVID-19 are submitted by participating critical care units either monthly or quarterly.

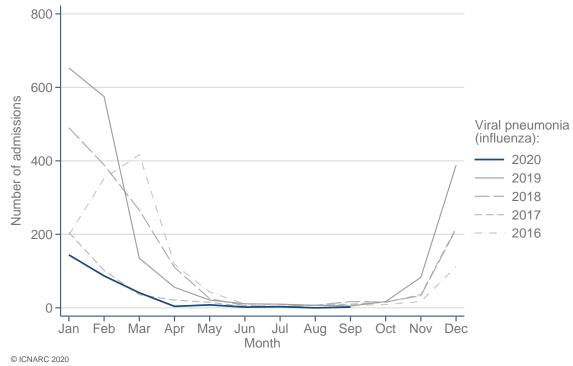

Figure 14. Number of admissions with viral pneumonia (influenza) by month, 2016-2020 *

* Please note that data for patients without COVID-19 are submitted by participating critical care units either monthly or quarterly.

Characteristics of patients critically ill with confirmed COVID-19 admitted from 1 September 2020 to date are summarised in Tables 1-3 and compared with patients admitted up to 31 August 2020.

	Patients with confirmed COVID-19	
Demographics	Admitted from 1 Sep (N=4035)	Admitted up to 31 Aug (N=10,910)

Advanced cardiovascular support	2 (1, 4)	3 (2, 6)
Total (advanced + basic) cardiovascular support	7 (4, 12)	11 (5, 22)
Renal support	4 (2, 8)	8 (3, 15)

Table 7. Critical care outcome, duration of critical care and organ support

Please note that the results for patients admitted from 1 September 2020 are biased towards patients with shorter lengths of stay in critical care prior to discharge or death, i.e. those who died or recovered quickly. * Please see Definitions on page 38. † Duration of critical care is the total over all critical care admissions for the the same patient and excludes any time spent outside critical care areas (e.g. prior to any readmissions). Characteristics of patients critically ill with confirmed COVID-19 and receiving invasive ventilation during the first 24 hours in critical care admitted from 1 September 2020 to date are summarised in Tables 4-6 and compared with patients admitted up to 31 August 2020. Critical care outcome, duration of critical care and organ support for patients critically ill with confirmed COVID-19 and receiving invasive ventilation during the first 24 hours in critical care admitted from 1 September 2020 to date for whom outcomes have been received are summarised in Table 8 and compared with patients admitted up to 31 August 2020.

Table 8. Critical care outcome, duration of critical care and organ support (inva-
sively ventilated first 24 hours)

Patients with confirmed COVID-19 invasively ventilated first 24 hours *		
Critical care outcome	Admitted from 1 Sep (N=797)	Admitted up to 31 Aug (N=5853)
Outcome at end of critical care, n (%)		
Discharged	218 (27.4)	3128 (53.4)
Died	266 (33.4)	2722 (46.5)
Still receiving critical care	313 (39.3)	3 (0.1)
Duration of critical care	(N=483)	(N=5846)
Duration of critical care (days) †, median (IQR)		
Survivors	10 (6, 16)	22 (12, 35)
Non-survivors	9.5 (4 <i>,</i> 15)	10 (5, 17)
Organ support (Critical Care Minimum Dataset) *	(N=478)	(N=5848)
Receipt of organ support, at any point, n (%)		
Advanced cardiovascular support	191 (40.0)	2384 (40.8)
Basic cardiovascular support only	287 (60.0)	3451 (59.0)
No cardiovascular support	0 (0.0)	13 (0.2)
Renal support	120 (25.1)	2113 (36.1)
Liver support	9 (1.9)	79 (1.4)
Neurological support	61 (12.8)	713 (12.2)
Duration of organ support (calendar days), median (IQR)		
Advanced respiratory support	8 (4, 13)	14 (7, 24)
Total (advanced + basic) respiratory support	10 (5, 15)	15 (8, 26)
Advanced cardiovascular support	2 (1, 4)	3 (2, 6)
Total (advanced + basic) cardiovascular support	10 (5, 15)	15 (8, 26)
Renal support	4 (2, 10)	8 (4, 16)

Please note that the results for patients admitted from 1 September 2020 are biased towards patients with shorter lengths of stay in critical care prior to discharge or death, i.e. those who died or recovered quickly. * Please see Definitions on page 38. † Duration of critical care is the total over all critical care admissions for the the same patient and excludes any time spent outside critical care areas (e.g. prior to any readmissions). A Kaplan-Meier plot of in-hospital survival to 28 days following admission to critical care for patients critically ill with confirmed COVID-19 admitted from 1 September 2020 to date is shown in Figure 22 and compared with patients admitted up to 31 August 2020.

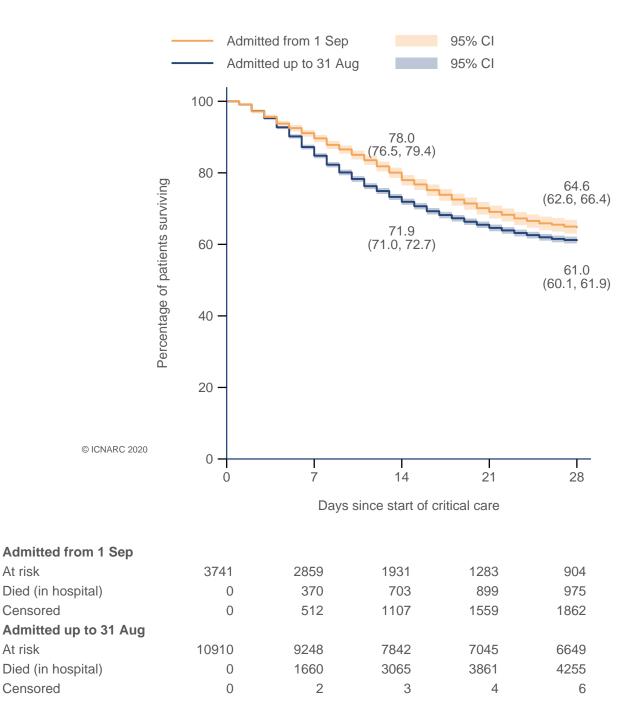

Figure 22. In-hospital survival to 28 days following admission to critical care

Kaplan-Meier survival analysis. Patients last reported to be still receiving critical care censored on the most recent date of data submission by the treating unit. Patients discharged from acute hospital within 28 days assumed to survive to 28 days. Please note that these survival curves are not adjusted for differences in patient characteristics (see Tables 1-3).

28-day in-hospital mortality for patients critically ill with confirmed COVID-19 admitted from 1 September 2020 to date by patient characteristics (demographics, medical history and indicators of acute severity) is presented in Figures 23-26 and compared with patients admitted up to 31 August 2020.

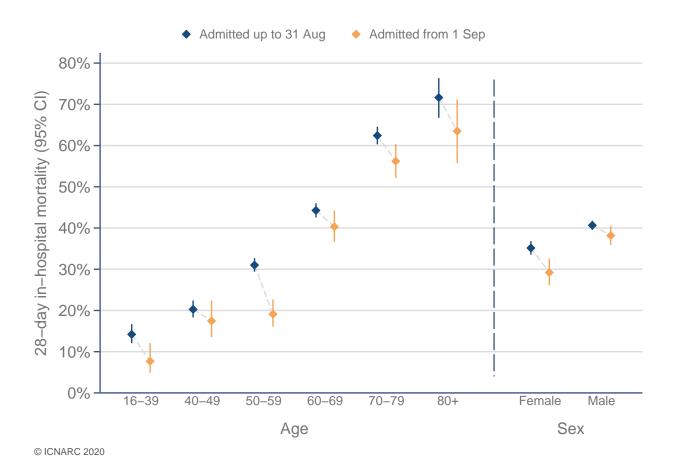

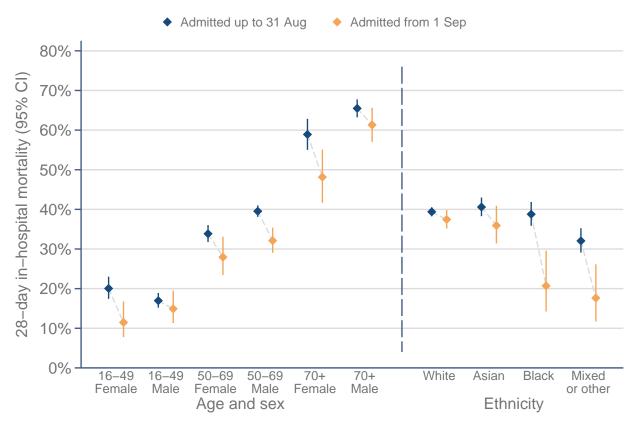

Figure 23. 28-day in-hospital mortality by patient characteristics (demographics)

Estimates of 28-day in-hospital mortality based on Kaplan-Meier survival analysis. Patients last reported to be still receiving critical care censored on the most recent date of data submission by the treating unit. Patients discharged from acute hospital within 28 days assumed to survive to 28 days. Please note that these estimates are not adjusted for differences in other patient characteristics (see Tables 1-3).

Figure 24. 28-day in-hospital mortality by patient characteristics (demographics continued)

Estimates of 28-day in-hospital mortality based on Kaplan-Meier survival analysis. Patients last reported to be still receiving critical care censored on the most recent date of data submission by the treating unit. Patients discharged from acute hospital within 28 days assumed to survive to 28 days. Please note that these estimates are not adjusted for differences in other patient characteristics (see Tables 1-3).

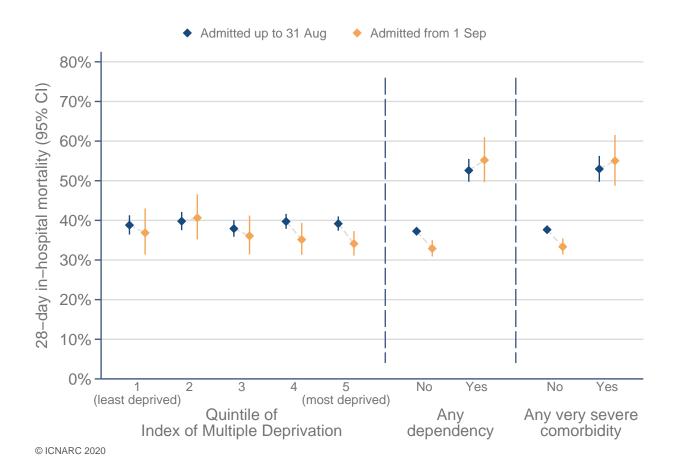

Figure 25. 28-day in-hospital mortality by patient characteristics (demographics and medical history)

Estimates of 28-day in-hospital mortality based on Kaplan-Meier survival analysis. Patients last reported to be still receiving critical care censored on the most recent date of data submission by the treating unit. Patients discharged from acute hospital within 28 days assumed to survive to 28 days. Please note that these estimates are not adjusted for differences in other patient characteristics (see Tables 1-3).

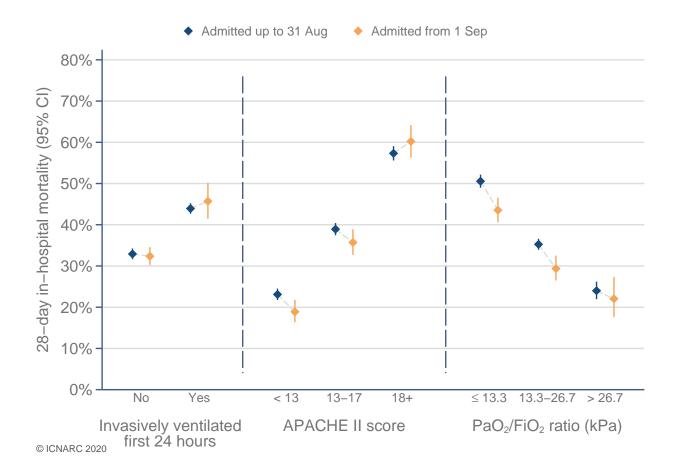

Figure 26. 28-day in-hospital mortality by patient characteristics (indicators of acute severity *)

Estimates of 28-day in-hospital mortality based on Kaplan-Meier survival analysis. Patients last reported to be still receiving critical care censored on the most recent date of data submission by the treating unit. Patients discharged from acute hospital within 28 days assumed to survive to 28 days. Please note that these estimates are not adjusted for differences in other patient characteristics (see Tables 1-3). * Please see Definitions on page 38. Indicators of acute severity are based on data from the first 24 hours of critical care.

Additional analyses for patients admitted up to 31 August 2020

Updated outcomes up to discharge from acute hospital for patients critically ill with confirmed COVID-19 admitted up to 31 August 2020 are shown in Figure 27.

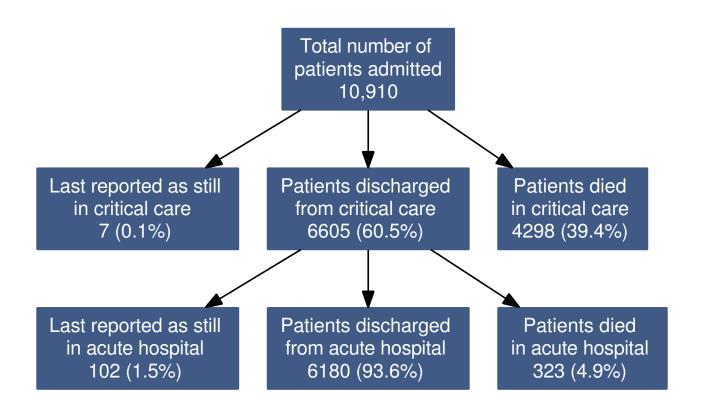

Figure 27. Critical care and acute hospital outcomes for patients admitted up to 31 August 2020 A Kaplan-Meier plot of in-hospital survival to 90 days following admission to critical care for patients critically ill with confirmed COVID-19 admitted up to 31 August 2020 is shown in Figure 28.

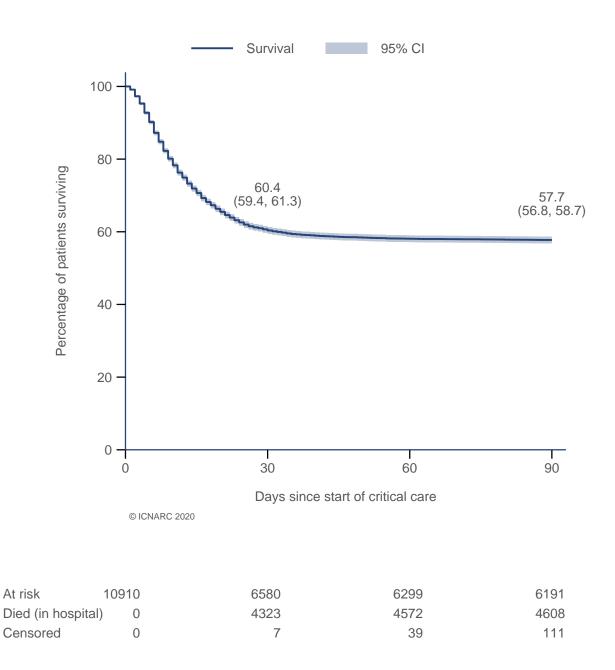

Figure 28. In-hospital survival to 90 days following admission to critical care for patients admitted up to 31 August 2020

Ethnicity is recorded using the ethnic category codes from the 2001 census and grouped as:

- White: White British; White Irish; White any other
- Mixed: Mixed white and black Caribbean; Mixed white and black African; Mixed white and Asian; Mixed any other
- Asian: Asian or Asian British Indian; Asian or Asian British Pakistani; Asian or Asian British Bangladeshi; Asian or Asian British any other
- Black: Black or black British Caribbean; Black or black British African; Black or black British any other
- Other: Other ethnic group Chinese; Any other ethnic group
- Not stated or not recorded

Index of Multiple Deprivation (IMD) is based on the patient's usual residential postcode (assigned at the level of Lower Layer Super Output Area) according to:

- English Index of Multiple Deprivation 2019 for postcodes in England
- Welsh Index of Multiple Deprivation 2019 for postcodes in Wales
- Northern Ireland Multiple Deprivation Measure 2017 for postcodes in Northern Ireland

Urban/rural classification is based on the patient's usual residential postcode (assigned at the level of Output Area) and categorised according to 2011 census categories as:

- Urban: the majority of the population lives within settlements with a population of more than 10,000 people, subcategorised according to dwelling densities for every 100m x 100m square and the density in squares at varying distances around each square as either Major conurbation, Minor conurbation, or City or town
- Rural: the majority of the population lives within settlements with a population of less than 10,000 people (combining the categories Town and fringe, Village, and Hamlet or isolated dwellings)

Body mass index is calculated as the weight in kilograms divided by the height in metres squared. Weight and height values may have been measured or estimated.

Dependency prior to admission to acute hospital is assessed as the best description for the dependency of the patient in the two weeks prior to admission to acute hospital and prior to the onset of the acute illness, i.e. "usual" dependency. It is assessed according to the amount of personal assistance they receive with daily activities (bathing, dressing, going to the toilet, moving in/out of bed/chair, continence and eating).

Very severe comorbidities must have been evident within the six months prior to critical care and documented at or prior to critical care:

- Cardiovascular: symptoms at rest
- Respiratory: shortness of breath with light activity or home ventilation
- Renal: renal replacement therapy for end-stage renal disease
- Liver: biopsy-proven cirrhosis, portal hypertension or hepatic encephalopathy
- Metastatic disease: distant metastases
- Haematological malignancy: acute or chronic leukaemia, multiple myeloma or lymphoma
- Immunocompromise: chemotherapy, radiotherapy or daily high dose steroid treatment in previous six months, HIV/AIDS or congenital immune deficiency

Invasive ventilation during the first 24 hours was defined as mechanical ventilation (identified by the recording of a ventilated respiratory rate, indicating that all or some of the breaths or a portion of the breaths were delivered by a mechanical device) and sedation (receiving continuous or intermittent doses of agents to produce and maintain a continuous decreased level of consciousness) at any time during the first 24 hours and not reported as having zero days of advanced respiratory support.

Organ support is recorded as the number of calendar days (00:00-23:59) on which the support was received at any time, defined as:

- Advanced respiratory: invasive ventilation, BPAP via trans-laryngeal tube or tracheostomy, CPAP via trans-laryngeal tube, extracorporeal respiratory support
- Basic respiratory: >50% oxygen by face mask, close observation due to potential for acute deterioration, physiotherapy/suction to clear secretions at least two-hourly, recently extubated after a period of mechanical ventilation, mask/hood CPAP/BPAP, non-invasive ventilation, CPAP via a tracheostomy, intubated to protect airway
- Advanced cardiovascular: multiple IV/rhythm controlling drugs (at least one vasoactive), continuous observation of cardiac output, intra-aortic balloon pump, temporary cardiac pacemaker
- Basic cardiovascular: central venous catheter, arterial line, single IV vasoactive/ rhythm controlling drug
- Renal: acute renal replacement therapy, renal replacement therapy for chronic renal failure where other organ support is received
- Liver: management of coagulopathy and/or portal hypertension for acute on chronic hepatocellular failure or primary acute hepatocellular failure
- Neurological: central nervous system depression sufficient to prejudice airway, invasive neurological monitoring, continuous IV medication to control seizures, therapeutic hypothermia
